

1. An  $m \times n$  matrix is said to be a queen if the restriction of  $A$  to the orthogonal complement of its kernel is an isometry.

(a) Show that  $A$  is a queen if and only if  $A^*A$  is an orthogonal projection.

(b) Show that  $A$  is a queen if and only if  $AA^*$  is an orthogonal projection.

(c) Show that a queen  $A$  is an isometry if and only if  $\ker A = 0$ .

**Solution:** If  $\ker A = \{0\}$ , then  $(\ker A)^\perp = V$ , so the restriction of  $A$  to the orthogonal complement of its kernel is  $A$  restricted to its domain. Then  $A$  is an isometry on any vector.

(d) Find an example of a  $4 \times 2$  queen that has non-zero kernel. Be sure to prove it's a queen!

2.

(a) Given a singular value decomposition  $A = W\Sigma V^*$  of a square matrix  $A$ , construct a polar decomposition of  $A$  using  $W, V, \Sigma$ .

(b) Using the method above, compute a polar decomposition for

$$A = \begin{bmatrix} 1 & 3 \\ 2 & 6 \end{bmatrix}.$$

3. Find your favorite  $4 \times 2$  matrix  $A$  of rank 2 and compute a singular value decomposition for  $A$ . All of the entries of  $A$  must be nonzero.
4. For an  $m \times n$  matrix  $A$ , show that the set of nonzero eigenvalues for  $A^*A$  coincide with that of  $AA^*$ .
5. Suppose  $A = W\Sigma V^*$  is a singular value decomposition for  $A$ . Show that the columns of  $W$  are eigenvectors for  $AA^*$ .
